1.0 – Introduction: Idea Description

The name of the game that we have designed is named *Retro Revolt*, a game featuring a humanoid android named Cee Arty whose physical form resembles that of an ordinary human, with the primary difference being their head, which is replaced by a CRT. The game's core structure revolves around Cee and their adventure through the city of Retropolis, in hopes of destroying the vengeful supernatural entity that has possessed and demonified the city's inhabitants.

The genre of *Retro Revolt* can best be defined as a two-dimensional (2D) role-playing-game (RPG) featuring elements from the subgenre known as Metroidvania. A metroidvania is defined as a game with non-linear environmental design that is interconnected, with a sense of progression stemming from gaining permanent upgrades that enhance or increase the abilities available to the player character (Rudolph, 2016).

The main theme of the game is lost media. Lost media refers to visual, audio or audiovisual media such as TV shows, video games and music that are believed to no longer exist in any format (both physical and digital). These pieces of media are also considered unacquirable legally. However, as the scope of lost media is narrow and restrictive, we decided to also incorporate video game franchises that are considered abandoned or long-forgotten. To avoid any copyright infringement and licensing issues, all the characters were merely designed with inspiration from existing intellectual properties (IPs) rather than directly plagiarising them.

The narrative surrounding the theme of *Retro Revolt* also serves as a critique of the capitalistic mentality of mega-corporations and their cutthroat abandonment of media in favour of immediate profits and avoidance towards royalty fees. This practice within the media industry is what ultimately led to the downfall of several pieces of media becoming inaccessible/lost, and the inactivity of old video game franchises.

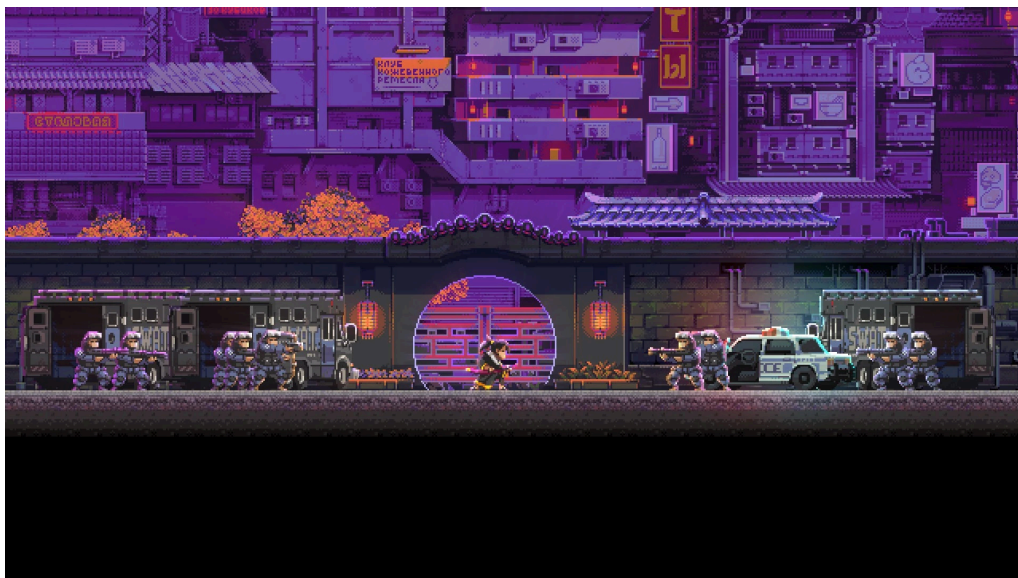

The setting of the game is named Retropolis, a runic, desolate cyberpunk-esque cityscape dimly lit by the fluorescent neon signs that flicker lifelessly after years of abandonment. Crumbling towers and empty streets populate the surface, with its small population count localised around

the cybernetic underground network that has also begun falling into decay. Most of the game takes place within these underground tunnels, as players must navigate through the winding corridors and pathways, occasionally charting a path across the surface to discover hidden items/entrances leading to other bases.

Visually, *Retro Revolt* takes inspiration from other contemporary video games featuring dystopian, metropolitan cityscapes such as *Stray* and *Katana Zero*.

Stray (2022)

Katana Zero (2019)

Meanwhile, the story of *Retro Revolt* can be summarised as follows:

“When an unknown storm engulfs the skies of Retropolis, Cee Arty finds themselves in a world where former friends are turned into maniacal foes. Mysteriously, only they are unaffected by the strange affliction that has corrupted the inhabitants of Retropolis, and now only they can stop the ensuing rampage of a vengeful spirit seeking to imprint itself onto the universe as they know it. With only a handful of cartridges and cassette tapes, as well as an arsenal of one-liners, Cee must free their compatriots from the hex that has bound them to the whims of the spirits, and uncover the true nature of the supernatural entity before Retropolis falls to ruins...”

The ultimate goal of the game is to uncover and access the area where the final boss/main antagonist of the game lays dormant - a dimly lit backroom enclosed in a completely isolated region of Retropolis. To achieve this, the players must control Cee Arty through the various sections of Retropolis' underground layout to defeat a gauntlet of mini-bosses, freeing their “souls” from the spirit's corruption to gain their abilities or radio frequencies, which will broaden Cee's toolkit and unlock more accessible areas the farther the player progresses. Once reaching the boss area, Cee Arty must engage in combat with the spirit of an old video game character that grew insane from centuries of isolation and detachment from the universe following the unexpected activation of the CRT the sole cassette tape is lodged into. Now having possessed the CRT itself purely with its amplified emotions and powers, the antagonist has similar powers and abilities matching Cee themselves; this forces players to understand and recognise the weaknesses of Cee based on their gameplay and exploit them to defeat the final boss, thus freeing the vengeful spirit from corruption and purifying the world of Retropolis once more. Thematically, the crux of *Retro Revolt* is serving as a homage to the forgotten media of yesteryear and allowing them to live on in remembrance in the minds of society.

Finally, the target audience of *Retro Revolt* is directed towards fans of the Metroidvania genre; however, it also caters thematically towards older gamers who have preferential bias towards long-forgotten or niche video game franchises, as well as fans of RPGs like the *Final Fantasy* franchise. The ideal ESRB rating for the game would be E10+, which means the game will be suitable for people ages 10 and up.

2.0 – General and Competitive Analysis

Retro Revolt draws inspiration primarily from video games in the Metroidvania genre - in particular, four games serve as strong inspiration for the game design of our title, whether it be thematic or systematic:

2.1 – *Hollow Knight* (2017)

Hollow Knight, developed and published by Team Cheery in 2017, is an action adventure video game about traversing and exploring the dilapidated and ruined kingdom of Hallownest in order to discover and fulfill your role as the savior who will contain the Infection that plagues the kingdom and its people. *Hollow Knight* is a side-scrolling “Metroidvania”, a genre which is defined by exploration and navigation of the world based on your current tools and abilities.

We’ve picked *Hollow Knight* as a prime example of the Metroidvania genre that is currently popular. Although the name of the genre comes from games “Metroid” and “Castlevania”, it outgrew those two franchises relatively quickly and peaked in popularity in recent times.

Hollow Knight also has a similar gameplay and combat to what we envision in *Retro Revolt*.

2.2 – *Ena Dream BBQ* (2025)

2.3 – *Epic Mickey* (2010)

Epic Mickey is a 3D platformer developed by Junction Point Studios and published by Disney Interactive Studios for the Nintendo Wii. The game centralises around the mechanics of a paintbrush capable of applying paint or thinner onto interactive objects in a setting known as the Wasteland. A morality system is introduced wherein Mickey can either choose to further desecrate the Wasteland and coldly eliminate enemies using thinner, or revitalise enemies and buildings alike using paint; the player’s actions have direct consequences towards the game’s overall difficulty. The narrative of the game focuses on portraying Mickey as an epic hero – he was abducted by the antagonists who reside over Wasteland, and must then work together with various Disney characters that were either retired or forgotten to time to not only escape Wasteland, but defeat the nefarious entity he inadvertently created in the past known as the Phantom Blob.

2.4 – *Zelda II: The Adventure of Link* (1987)

Zelda II: The Adventure of Link is the second entry in the prestigious *The Legend of Zelda* franchise, developed and published by Nintendo R&D4 for the Nintendo Entertainment System. This entry represented a great departure from the inaugural title in the series, introducing new mechanics such as a life system, experience points, magic meters and side-scrolling action. *Zelda II* also featured a combination of top-down overworld views when navigating the world of Hyrule at large, which is switched to a side-scrolling view when accessing key areas. The combat system is also largely different, requiring Link to alternate between crouching and standing when facing certain enemies, and levelling up to acquire additional combat moves. The story of *Zelda II* is simple as its core – Link needs to wake Princess Zelda from a deep slumber caused by a sleep spell.

2.5 – Comparison

Game	Hollow Knight	ENA Dream BBQ	Epic Mickey	Zelda II
Genre	2D Metroidvania with platforming elements	3D first-person exploration adventure game	3D platformer	2D action role-playing game
Features	Risky exploration of the world with a healthy mix of combat and platforming. NPC-based side quests with character development and rewards.	The abstract feeling of the whole pease. We want to make the enemy behavior algorithms feel like an enhanced, “fresh” look on the original patterns.	Platforming based on creating/destroying interactive objects, morality system (actions affect consequences), side quests, power-ups	Adventure game revolving travel around Hyrule to obtain the six crystals to uncover the Triforce of Courage; strategic combat system, detailed setting and lives system.

Mechanics	common 2D platforming mechanics: horizontal dash, double jump, wall jumps. Combat mechanics: Spell-casting through a resource, evasion through dashing.	We did not really take mechanics from ENA, we were just inspired by the artstyle and “Vibe”	Platforming mechanics: Double jump Paintbrush: Consumes auto-renewed paint and thinner. Used to generate / destroy objects to create / unblock paths while platforming. Also used to either destroy enemies or revitalise them into allies. Can also be used as a melee attack to hit switches.	Overworld in top-down perspective, key areas in side-scrolling perspective. Experience points for defeating enemies, levelling up enhances life energy, magic meter and combat abilities Combat system involving standing and crouching to deflect enemy attacks and strike weak spots.
Theme / Narrative	Exploration of a kingdom in ruin to save its citizens by sacrificing yourself. Storytelling is done through environment as well as NPC dialogue	Depending on how thorough you have searched the level and if you completed side quests you will get more details about the character that you would fight at the end of the level.. ENA has a similar approach to gameplay. The path to take in the fight is up to you, you can kill every corrupted piece of code or you can take your time and learn about their	Maintaining artistic integrity by remembering our roots as artists, and facing the consequences of negative actions and acting to correct them	Classic hero’s journey narrative; protagonist gathers items in quest to accomplish primary goal of rescuing someone.

		backstory, you will find a lot of interesting facts based on the real backstory of the lost media character.		
Visuals	Hand drawn simplistic textures and sprites with a somewhat gloomy vibe.	3D world with 2D pixelated textures and Phillips CD-i inspired character sprites	Cartoonish 3d graphics of sixth-generation level graphical fidelity, 480i resolution, 30 frames per second	NES-era 8-bit pixel sprites. 256 x 240 resolution, 60 frames per second

2.6 – Strengths and Weaknesses

Game	Hollow Knight	ENA Dream BBQ	Epic Mickey	Zelda II
Strengths	Intriguing and deep worldbuilding, engaging and rewarding exploration of the world. Great combat and decent platforming. Many side-quests and NPCs with well written storylines.	Unique art style reminiscent of mid 90s / early 00s media Immersive worldbuilding that perfectly adapts the animated series the game is based on	Unique approach to platforming with direct manipulation of platform's existence Strong narrative with poignant theming Gloomy visual direction complements environmental storytelling and gameplay	Introduction of complex and strategic combat mechanics Adaptation of RPG elements into the Zelda formula
Weaknesses	A jack of all trades, master of none (except maybe world design).	Unfortunately to get the full story of the game you will have to go down a very long rabbit	Unresponsive and unreliable camera Excessive	Absurd difficulty Large but bland overworld

	Some minor questionable game design choices.	hole and half play half read the wiki.	backtracking	Limited item progression Poor localisation and overly cryptic puzzles
--	--	---	--------------	--

2.7 – What *Retro Revolt* Does Better

In order to overcome the issues that the four aforementioned games faced upon release, we have taken measures to implement game design philosophies that address these weaknesses. First and foremost, the narrative and themes of *Retro Revolt* are immediately accessible for anyone regardless of familiarity with the source material its characters are inspired by. We believe that additional context should be optional when gauging overall enjoyment of a video game, and therefore we ensured the story of *Retro Revolt* is told cohesively in a single, seamless experience, allowing it to make sense when viewed individually.

The struggles *Epic Mickey* encounters with poor, inflexible cameras is a non-issue with *Retro Revolt* as it is primarily a two-dimensional video game. To further address any concerns players may have with environmental visibility, we have employed a dynamic camera system that pans out for wide, establishing shots to further immerse them into the narrative, and zooms in whenever the game intends for you to pay attention to a specific component of the map. In addition, we acknowledged that Cee Arty's sluggish movement may lead to backtracking being tedious for casual audiences; to combat this, we ensured that all mandatory components required to clear the game are in areas easily discoverable by the player, as well as granting Cee the Reality Byte ability that teleports them between key locations instantaneously (with limitations to prevent it from being abused).

There is no requirement for grinding either, as the power scaling of Cee's powers are based on acquisition of upgrades/power-ups rather than experience system-based levelling up. This, in turn, allows *Retro Revolt* to have a balanced difficulty curve, ensuring the player never faces an absurd difficulty spike that breaks the immersion of the experience. Furthermore, to ensure the

pacing of the game is smooth, items gained by Cee Arty are immediately useful to uncovering secrets in the world of Retropolis as well as unlocking new areas for further exploration; the interactive density of every area is also vastly increased without making areas overly spacious – this prevents the levels or dungeons from feeling “padded out”. Finally, the dialogue of *Retro Revolt* is written with grammatically correct English to prevent language barrier-based misunderstandings, and hints are explained clearly while not being too blatant to trivialise difficulty for the playerbase.

3.0 – Interface Document

The user interface (UI) of Retro Revolt is designed to reflect the game’s nostalgic and glitch-infused aesthetic — reminiscent of VHS tapes, 90s operating systems, and corrupted arcade cabinets. All menus and HUD elements are stylized with scanline overlays, pixel fonts, and CRT-style flickers, staying faithful to the theme of lost media and retro-futurism. Elements jitter occasionally, but not in a way that impairs readability — just enough to evoke a haunted, analog charm.

Main Menu

The main menu appears on boot with a grainy CRT startup flicker, revealing four key options styled like TV channels:

- Start Game
- Load Game
- Options
- Exit Game

Each option is surrounded by glitching borders and accompanied by a corrupted voice line (e.g., "Insert Cartridge..." when hovering Start Game). Navigation is horizontal using arrow keys or controller d-pad.

Pause Menu

Pressing the Start/Menu button brings up the Pause screen. It overlays a static-filled transparent CRT panel over the game world. Options include:

- Continue
- Map
- Inventory
- Save
- Options
- Quit to Main Menu

The interface flickers between pages with VHS-style rewind animations. Sound effects are distorted beeps and cassette clicks.

HUD (Heads-Up Display)

The in-game HUD is minimalistic and diegetic, inspired by interface designs seen in Metroid and Hollow Knight:

HP Bar – Top-left corner, styled as old CRT vacuum tubes. Each tube represents 1 HP. Tubes crack or explode when HP is lost.

Voltage Meter – Below HP. Appears as a horizontal bar filled with electric current. Shocks arc across it when near full.

Reality Byte Status – A flashing “RB” icon near the Voltage bar appears when RB mode is active. Turns red and vibrates when Voltage is low.

Inventory Shortcuts – Bottom-left. Icon grid of equipped items (e.g., Speaker, Remote, Battery), toggleable with d-pad.

Minimap Overlay (optional) – Top-right corner, 8-bit pixel minimap in grayscale, unlocks after finding a map terminal.

Dialog Box – Bottom-center, TV screen-shaped box with pixel fonts and glitch-text transitions. Text sometimes scrambles or autocorrects for style.

Boss Health Bar – When fighting a boss, a corrupted waveform bar appears at the bottom of the screen with CRT scanlines scrolling across it.

Navigation Flow

Main Menu → Start Game → Overworld Cutscene

Start Menu → Inventory / Map / Options (layered tabs)

Inspecting interactables (stores, terminals, doors) → Context-sensitive pop-ups with iconography resembling old OS tooltips

Options Menu → Tabbed pages: Audio, Video, Controls, Accessibility

4.0 – Actors Document

The population of Retropolis is sparse; as a result, only a handful of characters are properly defined within the scope of *Retro Revolt*. Excluding the final boss fight, there are 20 major fights across the entirety of the game's natural progression, with a further 8 being optional fights. Including protagonist Cee Arty and the main antagonist (the vengeful spirit known simply as D.R.E.A.M.), there are a total of 30 noteworthy characters present in the game. In this document, we will be highlighting the characteristics of the Cee Arty, D.R.E.A.M. and some of the notable boss characters present within the story of *Retro Revolt*.

4.1 – Cee Arty

Cee Arty is a bumbling but easy-going inhabitant of Retropolis, known for their quiet but earnest demeanour amongst the populace of the underground. Appearance-wise, they are a humanoid android wearing a plain hoodie and slacks, with their arms permanently attached to the sides of their torso. Instead of a normal head, Cee Arty has a CRT television for a head, which is constantly playing static feedback with the exception of a pair of eyes and mouth, granting them the capability of expressing emotion. This CRT is also capable of playing a limited set of phrases

that were originally jumbled lines from TV and video game footage had previously recorded prior to their appearance in Retropolis. Most are unaware of Cee Arty's origins, a secret that even they are incapable of answering, leaving their past shrouded in mystery. However, it can be assumed that much like the other inhabitants of Retropolis, they were also the protagonist of a long forgotten video game franchise in the distant future.

As the player character of *Retro Revolt*, the most noteworthy feature of Cee Arty's physical attributes is their slow movement speed. This is caused by the excessive weight of the CRT head causing their movement to be tepid and clunky without the assistance of additional power-ups and utilities. At their fastest, Cee Arty can only muster a light jog, which allows for acceptable and measurable speed balancing (allowing the environment to be designed in a way that can be fully immersive through the time spent within them). Early into the game, Cee is taught to use their power cable as a grappling beam, allowing them to latch onto cliffs and climb onto higher surfaces. Utilising the cable as well as the standard designated jump that Cee Arty can perform is integral to solving a number of platforming and positioning based puzzles required to navigate and discover the next area.

From a combat perspective, Cee Arty is able to launch projectiles in the form of cassette tapes from their built-in VHS player. This is their standard method of attacking, though a later mandatory upgrade accessible to the player installs a compact disk (CD) drive onto Cee's head, allowing them to also fire CDs as projectiles. Additionally, Cee is also capable of broadcasting certain radio frequencies or visual feedback, which are customisable and given a wider range of options throughout the game's progression. These abilities serve as debuffs for the target opponent, allowing Cee to inflict a temporary status condition onto them. Finally, Cee Arty has the mysterious supernatural ability to produce physical projections from their CRT screen, which can be manifested in the form of various attacks. This ability is known as a Reality Byte. Originally, Cee is only capable of producing Reality Bytes in the form of punching fists; this is expanded by defeating specific bosses throughout the game's progression; Cee's ultimate role in the game as the main protagonist is to pacify their former friends from the corruptive possession of D.R.E.A.M. – upon success, these friends will reward them with a cassette tape that Cee can record to unlock their signature ability they used during the boss fight.

From a thematic perspective, the characterisation of Cee Arty is intentionally vague so the player can insert themselves into the narrative and define their personality freely; this is to bolster the secondary narrative of *Retro Revolt*, which is that by being leaving a positive impact on those surrounding you through your actions, your very existence is significant.

4.2 – D.R.E.A.M.

D.R.E.A.M. (short for Distorted Reality Error Augmenting Mythic) is the secret main antagonist of *Retro Revolt*, and the primary source of the corrupt manifestations that seep through the peculiar storm clouds and maliciously possesses the inhabitants of Retropolis. It takes the form of a white-cladden humanoid jester with cartoonish proportions, which is its physical form that only can be manifested by the CRT its singular copy is embedded within. Its appearance takes inspiration from the character Nights from *Nights into Dreams*, as well as Native dream catchers.

D.R.E.A.M. was a character originally conceived as the protagonist of its own eponymous video game that was conceptualised by the inhabitants of Retropolis during an ancient time period. In that game, D.R.E.A.M. served as a misunderstood heroic figure who utilises its powers of corrupting their surroundings to erase and reverse the occurrences of tragic events, having to balance their absurd powers by ensuring they do not cause the destruction of reality. In summary, it was someone capable of fulfilling dreams at the cost of shattering the realities of others.

Unfortunately, D.R.E.A.M.'s video game would be placed into development hell following production struggles. This led to the sole copy of D.R.E.A.M.'s source code to be shelved permanently, embedded into a cartridge which was attached to a custom-built CRT with enhanced graphics for its time. Decades would pass as unknown events led to Retropolis falling into ruin, with the CRT becoming a distant memory, trapped beneath the rubble of an abandoned underground basement. D.R.E.A.M. would remain a forgotten relic of the past until the CRT mysteriously rebooted after a thunderstorm several decades prior to the events of *Retro Revolt*. The dream entity would remain trapped within the confinements of the CRT from that point forward, anguished over its incapability of being remembered or appreciated by anyone; this drove its spirit into insanity and vengefulness, which then manifested into the supernatural

corruption of the CRT it inhabits. Eventually, D.R.E.A.M.'s reality distorting powers began to surface in reality, thus forming the mysterious storm that threatens the peace of modern day Retropolis.

Much like Cee Arty, D.R.E.A.M. is also capable of manifesting objects through the CRT screen it possesses, granting it similar powers to their Reality Bytes. Ultimately, this character's purpose in the story is to drive the primary conflict and inciting incident that kick-starts the events of *Retro Revolt*.

4.3 – Miscellaneous Characters

Cee Arty is the sole playable character in *Retro Revolt*, with every other character actor serving as non-playable characters (NPCs). All noteworthy NPCs fall under the possession of D.R.E.A.M. at the beginning of the game, and Cee is tasked with defeating them in combat to release them from its corruptive abilities. Following their defeat, they no longer show any signs of hostility and become friendly NPCs.

As aforementioned in the idea description, we have decided to draw inspiration from lost video games and defunct video game franchises for notable characters within the world of *Retro Revolt* and Retropolis. These non-playable characters are interactable, and can provide narrative context through their dialogue to complement the ongoing story. Most NPCs are used to provide information about the world to the player, but some will provide the player with side quests while some offer Reality Byte abilities for Cee's use.

One such character is known as **Finicky Fish**, a direct homage to the mobile game phenomenon *Flappy Bird*. It is a robotic fish incapable of flapping its fins repeatedly, causing it to constantly sink immediately after swimming forward momentarily. Cee Arty encounters this character after acquiring the Waterproof Spray item from the store, granting them access to the submerged underground network – there, they must defeat the spirit possessing Finicky Fish, while having to time their movement correctly to avoid being struck by the sewage pipes that sweep across the screen momentarily. Once defeated, Finicky Fish will reward Cee with a radio frequency that

works exclusively in the underwater network to open specific pathways, allowing them to progress further in the game.

Another key character in *Retro Revolt* is the game's merchant - **Speedy Eye**. Inspired by the merchant Morshu from obscure Zelda title *Link: The Faces of Evil* for the Phillips CD-i, Speedy Eye is a poorly drawn caricature of a middle-aged man in elven clothing who is encountered by Cee Arty as the second boss fight of the game, located in the first underground network of Retropolis. There, the corrupt spirit will use lamp oil to immolate the floor periodically, prompting the player character to constantly be on the move to seek higher ground to avoid being damaged by the flames. They will also throw bombs at the player, which can be deflected by properly timed Reality Byte punches. Once freed from corruption, Speedy Eye will become the first of two merchants for Cee Arty, in addition to giving Cee the Reality Byte cassette tape for bomb throwing. Interacting with Speedy Eye will open a menu interface where players can purchase or sell items, which include consumable combat items, upgrades to basic abilities and occasionally, the rare Reality Byte ability tape.

5.0 – Actions Document

Much like the average Metroidvania, Cee Arty's available movepool is simplistic and veered towards familiarising players with the mechanics of the game – upgrades and additional moves are gradually introduced to the player at a steady pace to avoid overwhelming them and adding further diversity, encouraging these players to customise Cee's powers to best suit their style of play. This form of progression is akin to hallmark Metroidvania titles such as *Castlevania: Symphony of the Night* and *Hollow Knight*.

In this action documentation, we will be utilising the button mapping of Xbox controllers, as well as keyboard mapping as reference.

5.1 – Movement

Cee Arty is, like any typical video game character, capable of moving towards a specific direction by pushing the analog stick or pressing the designated directional key. This transitions Cee into a standard walk cycle which is slow and clunky, but offers more precision over

positioning. Cee can also jog by holding down the B button on a controller, which makes them jog forwards in a light sprint. Compared to their contemporaries from other Metroidvania franchises, their running speed is relatively slow. Letting go of the directional stick at any point will cause Cee to stop walking/running, with running causing them to jolt slightly forward due to the sudden shift in momentum.

In terms of vertical movement, Cee Arty can do a simple jump by pressing the A button/jump button, launching them in a designated trajectory depending on the direction inputted. This jump is later augmented and improved upon by defeating a boss that rewards you with boots with springs attached to the bottom – this allows Cee to perform a higher Spring Jump that scales double the height of a regular jump by holding the A button for a designated period.

Another key movement option for Cee Arty when discussing vertical scaling is the Grappling Cable. This is Cee's most versatile tool in terms of combat capabilities as well as exploration capabilities. After defeating the first boss of the *Retro Revolt*, the purified Retropolis inhabitant will offer to repair Cee's power cable; upon doing so, Cee is able to launch the cable towards any power outlet by pressing the LT trigger, utilising the voltage generated to pull themselves towards the outlet. This also serves as an effective way to recharge the Voltage meter required for Reality Byte techniques. The grappling cable is also usable in combat – by aiming it towards the opponent, Cee is able to launch themselves at the target, providing an opportunity to strike with close range attacks.

5.2 – Interactions

Cee Arty can interact with the world around them through various means. Typically, this would involve inspecting an object of interest using the Inspect button (set to the Y button by default), and in some cases allows you to perform object-specific actions. This is Cee's primary method of interaction, and is their main method of approaching NPC characters.

This is most notable with the merchant stores located in the first underground network of Retropolis, where speaking with the merchant with the Y button triggers a store screen where players are able to purchase items to assist them on their journey. This store refreshes depending

on the player's progression within the game, with items becoming increasingly pricier but more powerful depending on how close they are to clearing the game.

The Inspect button is also used to transition between the overworld (Retropolis Surface) to key locations. *Retro Revolt* implements an art direction akin to *Final Fantasy VII* and *Zelda II*, which blends the use of top down visuals for the overworld with dynamic 3D angles and side-scrolling perspectives respectively when entering key locations.

Once Cee Arty enters a key location, the player will be navigating a map of connected rooms in a smaller scale compared to Metroidvania maps. When Cee travels between rooms, a pseudo screen transition occurs where the game silently unloads the previous area once it is no longer visible (to conserve system memory) and loads all necessary objects in the upcoming area. To conceal the process of objects being removed from the screen, *Retro Revolt* ensures all transitions are done with the previous room fading to black, somewhat similar to how transitions are handled in *Metroid*. This is especially noticeable with intractable doors. All doors are opened by positioning Cee directly beside the door and inputting an upwards direction to cause the door to open. Some doors will remain locked to Cee Arty until they obtain the necessary radio frequency from a boss fight. These doors will have a special animation when first unlocked where Cee will play the frequency and cause the doors to distort briefly before becoming regular doors for easier access in future visits.

Finally, the Inspect button is also used to collect items; the player must press the button when a cursor indicator appears, signalling to them that the item is acquirable. Some items are unlockable collectibles, some are hidden Reality Byte tapes and some are key items required to make progress through the game.

5.3 – Combat

When engaging in combat, Cee Arty has a multitude of options. There's the standard attacks that Cee can deploy (performed with the X button), such as launching cassette tapes and CDs at the opponent, as well as melee options such as the Grappling Cable and a simple headbutt attack, where Cee bashes their TV head against the opponent for damage.

Besides that, Cee Arty also has the **Reality Byte** ability, which enhances their abilities while in a more glitched, corrupted state; players must press the LB button to trigger Reality Byte, allowing Cee to perform Reality Byte abilities by performing specific inputs. For example, in the mid-game players can bind X and right to launch an uppercut fist from Cee's screen, or bind X and up to launch a peashooter reminiscent of the weapons from the *Cuphead* series. Additional Reality Byte abilities can be unlocked by exploring the world of Retropolis, either as rewards from bosses that were purified, or as secret unlockables discovered by solving environmental puzzles across both the surface and the underground networks.

Standard attacks can also be performed by toggling Reality Byte - standard attacks become **News Flash**, which will cause Cee Arty's screen display to flash rapidly in many colours, confusing enemies in front of them and leaving them stunned momentarily. Inputting the jump button while in mid-air allows Cee to launch an **EMP Blast**, which launches an electric current in a wide radius that can damage and stun enemies that are more mobile or airborne, while clearing out all projectiles in the radius. Attempting to use the Grappling Cable while Reality Byte is enabled causes Cee to perform **VHS Bind**, where they launch a cassette tape that unravels and wraps itself around the nearest enemy, trapping them in place for a prolonged duration and dealing damage over time.

It is important to note that Reality Byte usage consumes the Voltage meter, which can either be recharged over time or through connection to a power outlet – this allows for the dynamic use of environments in combat as players can position themselves during a fight to quickly attach themselves onto a power outlet to grant Voltage recharge, thereby allowing them to continuously use Reality Byte during battles.

Finally, *Retro Revolt* features a small number of consumable combat items that can be applied using the R button – examples include Speakers, which can immediately push enemies away from Cee Arty; Remotes, which are capable of rewinding enemies' conditions to their previous state 15 seconds prior; and Batteries, which are rare but provide an instant recharge to Cee's Voltage meter.

5.4 – NPC/Enemy Actions

The non-playable characters in *Retro Revolt* are exceedingly simple – most NPCs do not offer much to the progression of gameplay following their initial defeat except provide contextual dialogue related to the story of the game when Cee Arty interacts with them. Some NPCs do offer side quests when interacted with, promising rewards in the form of optional upgrades and Reality Byte tapes.

Enemies in *Retro Revolt* are defined as hostile NPCs that immediately attack Cee Arty on sight. They can only be interacted with through means of combat. There is a designated hierarchy tier that determines the importance of the enemy to the game:

The first tier, and the least significant enemy type are known as fodder enemies. Fodder enemies roam their designated locations and respawn every time you enter a certain area. Compared to most Metroidvania titles, there are fewer fodder encounters during the player's travels through a key location – they exist solely to encourage player interaction with the game while navigating otherwise uneventful environments. This is an approach that is similar to *Metroid II: Return of Samus*, which is known for its atmosphere where enemies become less common the stronger the miniboss in the area, until fodder enemies cease to exist in the late stages of the game. Fodder enemies will immediately dart towards Cee Arty when they are in proximity, with each species of fodder having a fixed attack pattern. They cannot be purified as they were never corrupted in the first place, due to them being regarded as the “organic creatures” of Retropolis. They also do not drop any special items or loot upon being defeated.

The second tier of enemies are mini-bosses. These consist of the majority of notable NPCs that the player must fight to purify from the corruption of D.R.E.A.M. They serve to challenge the player's expertise in combat as well as handling the mechanics that were previously introduced. They might serve as a guard to the boss' location or to key items required to access deeper regions of the underground network, or Reality Byte upgrades. Mini-bosses possess a much more complicated moveset compared to lesser ones, making them tougher foes to fight. As mentioned, all mini-bosses are converted into friendly NPCs once defeated.

Finally, there are five NPCs that are significantly stronger compared to the mini-bosses. These are the bosses of *Retro Revolt*. Bosses are special encounters with a massive HP pool, different attack patterns and a guaranteed special reward upon defeating them. Bosses serve as an ultimate check of the player's understanding of game mechanics and gimmicks. Some bosses possess multiple phases and undergo a transformation after reaching a specific damage threshold, changing their attacks and behavior. Much like mini-bosses, bosses turn into friendly NPCs upon defeating them, with a singular exception who chooses to self-destruct for story purposes.

6.0 – Behaviors Document

6.1 – Behaviour Patterns and Triggers

The behavioural patterns of NPCs in *Retro Revolt* can largely be broken down into two major components: an idle state and a combat state.

Enemies in *Retro Revolt* are always idle upon being spawned. In this state, they do not act aggressively towards Cee Arty because Cee are not within the proximity range or line of sight which triggers combat state. Idle state exists in 3 variants, with some enemies only having 1 behavior, and some switching between them over time:

The first idle state is “Stand”. While an enemy is in this state, it remains stationary, waiting for Cee Arty to either get close enough and enter its line of sight so it can start attacking, or for Cee Arty to attack it first.

The second and the most common idle behavior is “Patrol”. Patrol is a behavior pattern where an enemy travels in a trajectory that encompasses multiple areas of the stage, simulating the motion of patrolling these sections. Some patrolling enemies might pause at one of the patrol points and enter “Stand” state momentarily. Enemies that primarily behave in Patrol state tend to be smaller and harder to hit in combat state, and attack at high speeds, but they take lesser hits to defeat.

The final Idle behavior is “Wander”. Wandering enemies are transfixed to a single point and

randomly move around it without leaving the radius. This behavior exists for the same reason “Patrol” does, but it either implies that the enemy prioritises defensive maneuvers compared to the aggressive enemies that patrol their areas. Enemies in Wander state may occasionally enter Stand behavior for a while, before resuming their Wander behavior. Enemies that primarily behave in Wander state tend to either be bulkier in terms of health, and their attacks are launched at slower rates, in exchange for being more potent and dangerous to Cee Arty.

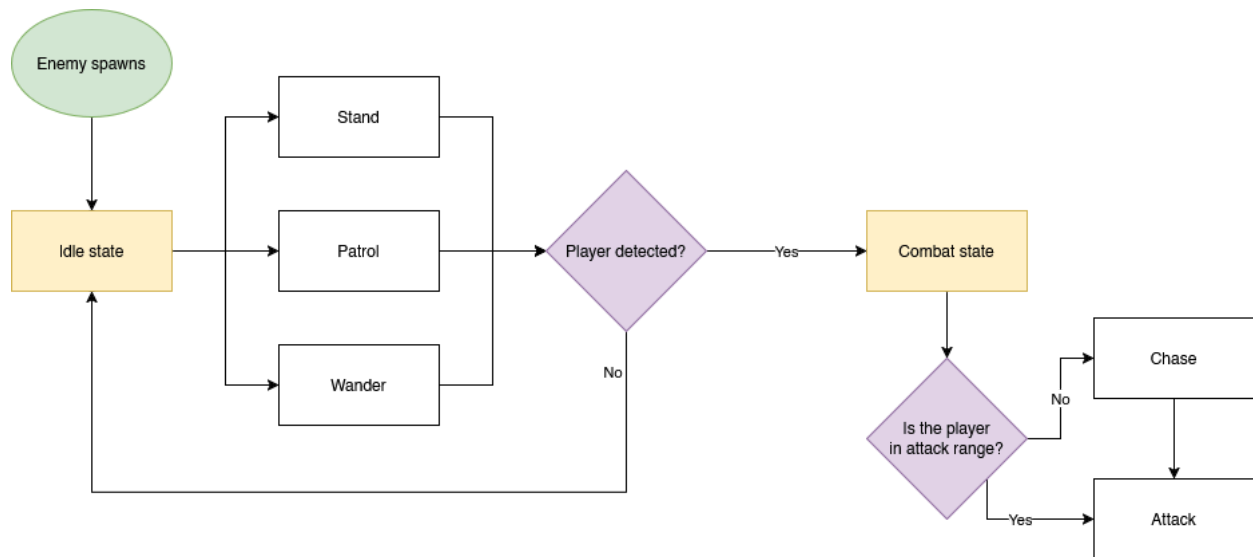

When Cee Arty attacks an enemy unprovoked or enters the proximity range or field of vision of an enemy, the enemy will immediately transition between the passive idle state to the aggressive combat state to engage Cee in battle. When the player is within the proximity range of a miniboss/boss, the music will automatically fade into silence to indicate that an important event is going to happen. During combat state, enemies can exhibit one of two behavioral patterns, depending on the enemy’s position relative to Cee Arty. If the enemy isn’t close to Cee Arty, they chase them, if they are in range, they attack.

Enemies enter “**Chase**” behavior as soon as Cee Arty is in their line of sight, and near the enemy (every enemy has a different detection field radius). In chase state enemies approach Cee Arty until they are in their attack range. Enemies’ attack ranges are unique; Close combat-based enemies’ attack range will therefore be a lot smaller than long range, projectile-based enemies. Chase behavior ends when an enemy’s attack range overlaps with Cee Arty, which is when the enemy transitions into Attack state. If the player gains enough distance from an enemy in chase state, while breaking line of sight (hence successfully avoiding and escaping the fight), the enemy will lose interest and go back to its original location and revert to idle state.

In “**Attack**” state enemies will attack based on programmed patterns in order to hit Cee Arty. Most notable enemies will have multiple options when attacking Cee; an algorithm cycles through all the attack patterns and randomly selects one to use unless programmed otherwise. For example, a long ranged miniboss may start shooting Cee Arty from a distance, but may suddenly enter an attack pattern where it draws near Cee and launches a melee attack. For boss fights, the boss might even transition to a wildly different attack state after its health is lowered

to a certain threshold. An enemy in attack state will remain in it until Cee Arty either defeats it or runs away from it, the latter of which makes it enter the chase behavioural pattern.

Here's a flowchart for enemy behavior patterns:

The image below demonstrates the algorithm behind Finicky Fish, as an example:

```

1  START
2  SET SPEED = 5
3  SET PROXIMITY = COORDINATES OF CRT
4  SET SECTION = SECTION OF FINFISH
5  SET STATUS = PATROL
6  SET TIME = GAMETIME
7  SET HP = 500
8  SET ATTACK = [ATK1, ATK2, ATK3]
9  REPEATUNTIL HP = 0
10  WHILE PROXIMITY < 200 DO
11      SWIM LEFT
12      IF SECTION = 41 THEN
13          SWIM DOWNWARDS
14      ELSEIF SECTION = 46 THEN
15          SWIM RIGHT
16      ELSEIF SECTION = 52 THEN
17          SWIM UP
18      ENDIF
19      FOR I = 0 TO 100 DO
20          IF I = 50
21              SET STATUS = STAND
22              WAIT 5 SECONDS
23              SET STATUS = PATROL
24          ENDIF
25      ENDFOR
26  ELSEWHILE
27      SPEED = 10
28      SET STATUS = CHASE
29      SWIM TOWARDS PROXIMITY
30      IF MUSIC_VOLUME != 0 THEN
31          MUSIC_VOLUME -= 5
32          REPEAT UNTIL MUSIC_VOLUME = 0
33      ENDIF
34      IF PROXIMITY <= 15
35          SET STATUS = ATTACK
36          RETURN FIGHT
37  ENDWHILE

```

```

38  STATUS = FIGHT
39  WHILE HP > 0 DO
40      FOR I = 0 TO GAMETIME DO
41          ATTACK = ATTACK[RANDOM]
42          IF I = 20
43              ATTACK = ATTACK[PIPES]
44          ENDFOR
45      IF PROXIMITY > 200
46          SET STATUS = CHASE
47          MUSIC_VOLUME = USER_SET_VOLUME
48          EXIT
49      ENDIF
50  ENDWHILE
51  FINISH

```

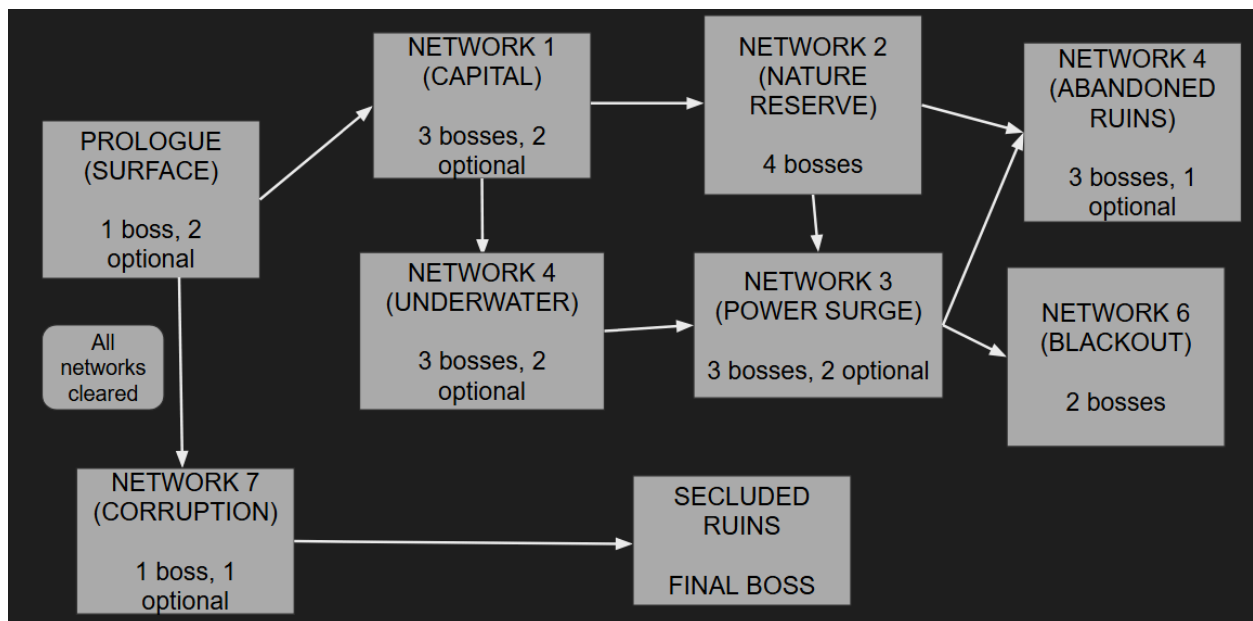

6.3 - Friendly NPCs' behavior patterns

Speedy Eye (Shopkeeper):

Speedy Eye, once defeated as a boss, becomes a shopkeeper and opens a shop called “**The Eye-Catcher**”, that is accessible from the Overworld and is located right beside the location where Speedy Eye was fought in. Upon entering The Eye-Catcher, you can interact with Speedy Eye to look at his stock, buy/sell items, or upgrade various equipment. Speedy Eye never leaves his shop throughout the playthrough, so it's always accessible. The Eye-Catcher's stock updates based on your progression through the game, it will sell better equipment and Reality Byte upgrades as you defeat other bosses.

7.0 – Level Documentation

The level structure of *Retro Revolt* is reminiscent of *Metroid Fusion* – a semi-linear experience through a series of different environments which are unlocked segment by segment after completing key tasks within the given environment. While *Retro Revolt* does take a similar approach, we aim to provide the player with more freeform agency in deciding their path towards the final boss. The game world is split into two main types of areas: Retropolis Surface (where a top-down perspective is utilised) and the Underground Networks, with distinct visual styles and gameplay mechanics for each. Visually, each dungeon becomes a self-contained homage to the forgotten era or genre the boss represents — from 16-bit platformers to polygonal PS1-era horror.

The diagram above shows the level progression of *Retro Revolt* - as observed, the level structure mostly branched, with all 6 main underground networks mandatory for exploration before unlocking the 7th and final underground network, which has suffered the most drastic effects from D.R.E.A.M.'s corruption. Each network can be considered its own level, with some only being unlocked upon clearing a specific network.

1. Retropolis Surface

This is where the prologue of the game occurs. In this stage, Cee Arty witnesses the storm conjured by D.R.E.A.M.'s corruption consume Retropolis, and seeks out the capital to investigate the situation. However, they are interrupted by their friend who has fallen under the corruption. This is the first boss fight of the game, and serves as an introductory tutorial to familiarise players to the controls and mechanics of *Retro Revolt*, as well as an introduction to Reality Byte as a mechanic. Once Cee Arty successfully purifies their friend, they are told of the unfolding disaster, which prompts Cee to take action and set forward on a quest to free the inhabitants of Retropolis from this mysterious blight. Before departing, Cee Arty has their Grappling Cable repaired by their friend, hence unlocking the relevant ability utilising it.

2. Underground Network 177 - Capital

As implicated by the name, Underground Network 177 is the capital network of Retropolis. It has the most modern technology within the city and is relatively well-maintained, with freshly painted walls and data glowing faintly as they are transmitted through the ceiling and the floors of the network. The network represents the stereotypical post-apocalyptic cybernetic world that is portrayed in most media, albeit slightly worn down due to the nature of Retropolis as a world. In this level, Cee Arty encounters Speedy Eye the merchant, is introduced to consumable items and customisable Reality Byte loadouts for the first time, and obtains the radio frequency required to activate the anti-malware signal waves that converts Network 177 into a safe haven during the disaster – defeating and purifying the guard protecting the anti-malware servers in the process.

3. Underground Network 7290 - Leaf

One of two areas unlocked following the clearing of the Capital, Network 7290 was formerly an underground botanic museum maintained by the ancient inhabitants of Retropolis. Due to the unexplained events that led to the eradication of most of the populace, the plants grew wildly out of control, and eventually infested and consumed Leaf entirely. The paradise was later maintained by the 3 self-hired ‘gardeners’ who destroyed most of the hazardous flora that could endanger Retropolis if let loose. With all the gardeners falling under the possession of D.R.E.A.M., Cee Arty must navigate the

unrestrained fury of Leaf's floral paradise, exorcise the spirits corrupting the gardeners, and ultimately use their newly unlocked flamethrower Reality Byte to burn down the monstrous plant that has acid corrosive enough to instantly melt any of Retropolis' inhabitants.

4. Underground Network 384 - Shockwave

The other area unlocked upon completion of the Capital. Network 384 is much like the Capital in the way its technologically up to standard; however, a faulty circuit board that is completely blocked off to the inhabitants of Retropolis has caused the floor to be permanently overcharged, causing many casualties in the process when the circuits overload and release powerful static discharge. As such, only beings capable of flight inhabit this area. This network aims to challenge the player's precision and timing, as well as their adeptness in combating aerial opponents. The objective leading to the completion of this level is to acquire a certain Reality Byte power from Network 7290, which allows Cee to destroy the obstacles blocking access to the circuit board. Once the circuit board (which has also been possessed) is purified and neutralised, the floorboards are no longer electrified, making it safe for Retropolis' populace to visit the network once more.

5. Underground Network 10000 - Hydro

This underground network is located deep beneath the surface of Retropolis, having the lowest altitude of all the main networks. As such, most of its rooms are permanently submerged in water, requiring visitors to have waterproof capabilities before accessing the facility. Cee Arty can visit the facility after purchasing and applying the Underwater Spray from Speedy Eye's merchant store. This level serves as a gauntlet of endurance and adaptability for the player, as they must adapt to the floatier underwater physics, time-based water dispensers and the fact that using any electrical attack will automatically consume the entirety of the Voltage meter in exchange for greatly damaging surrounding enemies. As such, players must conserve their use of the Grappling Cable, reserving it for the perfect time and plot their traversals wisely to make use of discoverable water-free cellars where Cee Arty can refill their Voltage meter.

6. Underground Network 02 - Ancient

This underground network is only discoverable by defeating the boss of Network 7290 or uncovering the hidden passageway located in Network 384. Compared to the previous architectural design of Retropolis' underground networks, Ancient resembles an underground strip mall from the 90s, replacing fluorescent neon lighting with warm, fading light bulbs and metallic flooring with concrete slabs. Unfortunately, the residents of Ancient were experimenting with Reality Byte technology which has caused the gravity in this underground network to change unexpectedly when stepping on certain tiles – Cee Arty must manipulate the gravity switches to their advantage to solve various puzzles while defeating the scientists and researchers who vandalised the network. Upon defeating the head scientist in the research camp they established, Cee Arty will acquire both a secret frequency used to access the server room in Network 456, as well as a hardware upgrade enabling Global Positioning System (GPS) functionality; this, by extension, allows Cee Arty to perform fast travel with Reality Byte.

7. Underground Network 84 - Flicker

The layout of Network 84 is deceptively simple – despite having visual similarities to both Capital and Shockwave, Flicker's visibility is marred by the constant flickering of the lights caused by disrepair, once again forcing Cee Arty to manage their Voltage meter wisely while using a previously unlocked Reality Byte ability obtained in Shockwave to illuminate the pathway ahead. To prevent this level from being a massive difficulty spike, the exploration factor of Flicker is reduced during the initial visit, railroading players to the main server room, where Cee Arty can restore power to the lighting grid in the underground network. This, however, also initialises the two bosses that roam the network, with one of them immune to any form of aggression until its counterpart is downed – and it is trapping the singular exit from the network. Therefore, Cee must play a dangerous game of cat and mouse with the other boss who, instead of directly approaching Cee like most bosses in the game, actively runs from Cee – forcing Cee to solve light-based puzzles to uncover the secret base where the boss dwells, thus setting off a chain reaction that ends with Cee defeating and purifying both bosses, as well as acquiring the Reality Byte ability that allows them to teleport through thin static walls, granting players the opportunity to backtrack and unlock previously inaccessible secrets and hidden items.

8. Underground Network 456 - Dream

A jagged, broken platform with a massive visual glitch at its center – a swirling distortion of code and pixel fragments. In an ironic twist, this network has suffered the most corruption from D.R.E.A.M., and as such reality (including the structure of the network itself) is stuck in a corrupt, distorted loop that forces players to adapt swiftly to the shifting environments and memorise the true layout of the network in order to reach the server room, which can only be opened by acquiring the specific radio frequency obtained from the boss of Network 02. There, Cee Arty must face off against the penultimate boss of the game – a powerful swordsman who was previously the guardian hero of Retropolis, capable of parrying attacks and deadly close-range combat. Once defeated, the hero shows Cee Arty the coordinates showing the origins of the corruption, prompting Cee to use the GPS upgrade acquired from the boss of Flicker to discover the location of the final boss – in the Secluded Ruins.

9. Secluded Ruins

This area is special in the sense that it only has 4 rooms, all of which are blocked off by various obstacles; requiring Cee Arty to maximise usage of their Reality Byte abilities to bypass the blockages before finally crossing paths with a lone chamber, with the CRT containing D.R.E.A.M. lying at the heart of it. There, Cee Arty must utilise every skill honed throughout their journey in *Retro Revolt* to finally defeat the possessed CRT final boss, exorcise the corruption storm emitted by D.R.E.A.M., before releasing the game cartridge from the CRT and finally granting the antagonist the freedom they long sought after.

8.0 – Gameplay Document

8.1 - Core gameplay loop

Retro Revolt's gameplay loop is similar to most Metroidvanias. The game's final area where you fight the final boss is inaccessible at the start of your playthrough. To access this area you'll need to explore other areas of the world, collect items and unlock abilities. Upon defeating the other bosses - and freeing their souls, you unlock the final boss and the area where it resides.

Therefore, the gameplay loop of this game looks like this:

Go into a new area → Explore the location → Fight a boss/Overcome a challenge → Collect a new item/ability that lets you access another location → Repeat.

8.2 - Mechanics and Gameplay

Combat

There is no specific “combat state” in *Retro Revolt*. While exploring an area, enemies who are close to you might notice you and attack. Combat in *Retro Revolt*, like in many other games, consists of hitting the enemy while not getting hit yourself. Cee Arty’s slow movement speed emphasises a more tactical and patient approach to combat, only a person who’s completely proficient in *Retro Revolt*’s combat will be able to rush into a horde of enemies and come out unscathed.

Exploration

Retro Revolt’s world consists of 2 layers: Overworld and specific locations.

Overworld serves the purpose of connecting all other locations into a coherent world you can venture freely through. When picturing *Retro Revolt*’s overworld - think of *Final Fantasy VII*’s world map or *Chrono Trigger*’s overworld.

When you enter a location through Overworld you transition from top-down view to a side-view. Some of the locations will start with a room that has an obstacle which can only be overcome using a specific item or ability, this is to ensure that the player has to gradually progress through the game while not being absolutely obliterated by enemies with higher stats. These specific locations are where the exploration actually happens. You navigate tricky landscapes, fight foes and look for treasure. In these locations not everything might be immediately accessible, but exploring everything is the main way of progressing through the game. Some of the locations are classified as dungeons, more about them in the next segment.

Dungeons

Dungeons in *Retro Revolt* are known as Underground Networks. They are defined as self-contained locations with an item/ability unlock found inside them that helps you progress the game, and a boss at the end. This definition is not entirely original and is inspired by dungeons from other Metroidvania titles and some The Legend of Zelda games.

Dungeons differ from other areas by not leading anywhere, dungeons end in a bossfight and nothing else. They also only have one entrance which also serves as an exit.

All dungeons follow a similar formula: Enter the dungeon → Explore the dungeon (fight enemies, solve small puzzles) → Encounter a roadblock that checks if you've found the dungeon's item → Take a detour and discover the item → Overcome the roadblock → Fight the boss of the dungeon.

8.3 - Resources

HP

At the start of the game Cee Arty has 5 units of HP. HP is relatively scarce in *Retro Revolt*, while replenishing your HP is easy, to expand your HP bar you need to collect specific items. "Tube pieces" are scattered across Retropolis, and collecting 3 of them will automatically transform them into a single "CRT". By collecting CRTs you replace the old tubes in Cee Arty's head which adds +1 hp per tube to your HP total. Enemies deal 1-3 HP per hit with enemies' strength increasing throughout the game.

Voltage

The voltage meter is the equivalent of the magic meter that is used in most RPGs. It is Cee Arty's primary resource for summoning Reality Byte abilities, with each Reality Byte and Grappling Cable use consuming portions of the Voltage meter. While the passive recharge timer of Voltage is incredibly slow, players can take advantage of power outlets placed throughout the level (which double as temporary autosave points) to recharge the meter at a faster rate. Voltage consumption depends on the strength of the move used, with some moves capable of depleting the entire energy bar

8.4 - Difficulty levels

As mentioned previously *Retro Revolt* has 3 difficulty settings: Easy, Medium and Hard. We chose the number three not only because it's a standard but also because it covers what most people expect from a game: Some people don't want to bother with difficulty and just go through the game without any frustration, some people want a balanced experience, and some want a challenge. Here's a rough breakdown of the three difficulty settings:

Easy

In some games, easy difficulty is also called a “give me the story” difficulty, because it’s mainly included for people who want to play the game for its story, not gameplay. In *Retro Revolt*, easy difficulty accommodates the player by making changes to enemies’ AI and stats. First of all, enemies in general (all enemy types and bosses) deal less damage to the player and have slightly less hp. Bosses’ stats are adjusted in a way that won’t make them a complete cakewalk but removes any chances of players getting frustrated. Enemy AI is adjusted to noticeably increase the delays between enemy attacks and make lesser enemies less aggressive towards Cee Arty. Bosses’ attacks are adjusted to leave longer punish windows between attacks.

Medium

Medium is the balanced difficulty. This is how we, the developers envision the standard *Retro Revolt* experience for an average gamer. Not difficult by itself, but challenging in some ways.

Hard

Hard is designed mainly for people who’ve already completed *Retro Revolt* and want to challenge themselves. Enemies’ HP is slightly higher (no damage adjustments though), they become way more aggressive and punish your misplays harder. This is where you really wanna think about what you’re doing and how you approach enemies. Bosses have a bit more hp, to make the fight a bit longer, and most bosses have a couple of new attacks exclusive to the hard mode. In general, bosses are faster and stronger. D.R.E.A.M unlocks an entire new phase at the end of its fight in addition to new attacks. Pick this difficulty if you’re ready to learn from your mistakes.

8.5 - Win/Lose conditions

You “**Win**” when you defeat the final boss and complete the game.

You “**Lose**” when you die. Dying makes you lose half of your screws (which is restored upon visiting the location of your death), and respawning right outside of the location you were in, in the Overworld. Upon dying and respawning all lesser enemies that you’ve defeated previously

will respawn. There is no “lives counter” and the player is free (and is encouraged) to try again over and over.

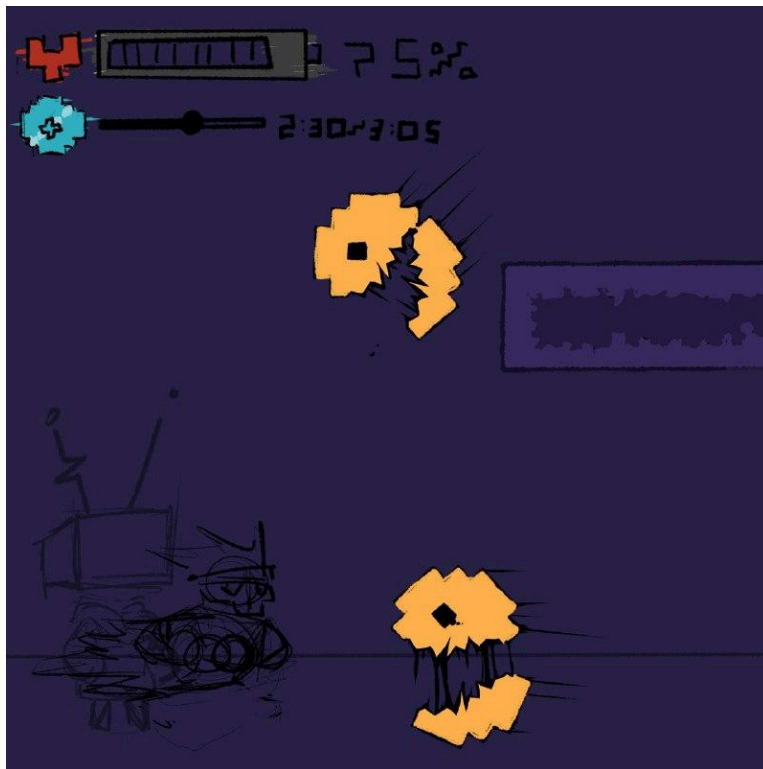

9.0 – Options Document

- Volume adjustment sliders
 - Music volume slider (0-10)
 - SFX volume slider (0-10)
 - Master volume slider (0-100)
- Controls/Button mapping settings
 - Every button/action can be remapped to another button
- Image settings
 - Window resolution adjustments (from 360p to 2160p)
 - Additional resolution adjustments (widescreen support)
 - FPS adjustments (30/60/120)
 - Vsync toggle
 - Fullscreen toggle
 - Brightness adjustment slider (0-100)
- Difficulty options
 - Three difficulty settings: Easy, Normal and Hard; made for general non-gamers, casual gamers, and those who need a challenge accordingly.
 - After completing the game a “New Game+” becomes available, with different enemy placements and increased difficulty. In New Game+ you start the game again without losing all your items from the previous completion.
- Accessibility features
 - “Colorblind mode” Will be implemented to make sure that colorblind people will be able to freely distinguish any visual elements of the game.

There will be different options to accommodate most types of colorblindness.

10.0 - Supporting Documents (Concept Art)

Interface Design
